

REPORT ON Weather API PROJECT

INTRODUCTION

This weather api project is designed to provide the weather information for a specified location. This project consists of user-friendly website interfaces such as HTML,CSS and javascript. Users can input a city name,and the website displays the weather information for that location including temperature,humidity,wind speed and pressure.

STRENGTH

- This project integrates the open weather api to fetch data.
- The website presents weather details comprehensively, including temperature,wind speed, humidity and weather conditions icons which provide comprehensive information to users.
- This project incorporates responsive design techniques using CSS.

Overall the weather api project boasts several strengths that contribute to its effectiveness in delivering weather information to users. These strengths make it a valuable tool for individuals seeking reliable and accessible weather data.

WEAKNESS

- This project lacks the implementation of the geo-location feature.
- The project includes the API key directly in the javascript code, which poses a security risk.
- In this project, the current data only gets displayed, but not the data of 1 week.
- Low storage is not available.

CONCLUSION

In conclusion, the Weather API report emphasizes the potential of the project to deliver valuable weather information to users. It is a user-friendly open weather API which contributes to its strengths. However, addressing the weaknesses, I will try to improve forecast accuracy, enhance error handling and secure the API key, which will elevate the project's overall quality.

Thank you

Best Regards,
